

Band: range over four independent chains, not a confidence interval.
Route points carry no interval in the archived summary.

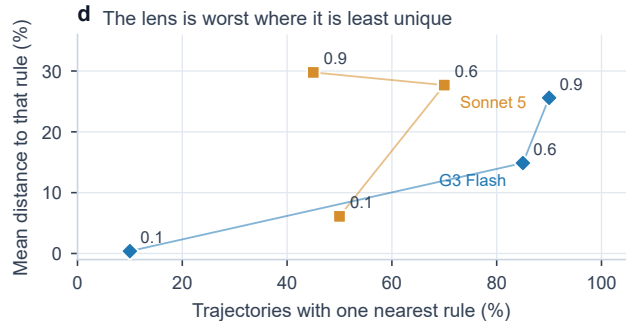

Points sit on the risk they were run at; no dodge is applied.

AS: Always Safe AU: Always Unsafe
CS / CAS: conditional, starting Safe / Unsafe

Evolutionary curves are the reconstructed model at the two parameter points its source text declares; route points are pooled decision frequencies from 10 races and 186 decisions per route and risk. The two objects are not samples of the same process, and nearest-rule labels are a distance to a fixed rule, not a recovered policy.

A trajectory with no unique nearest rule, or a large distance to it, is a label the data does not support.
