

Gemini 3 Flash, 10 races per cell, self-play. Hatched: the cell contained no safe decision at all, so it is pinned and its distance from the cells below is a floor, not an estimate. The column is not group size alone: all-safe pays +1.0 at $N=2$ and -0.2 at $N=5$.

Near-parallel is not flat, and the two signs above point opposite ways: they are race story minus neutral, and Safe = P minus Safe = Q. So the race story lowers Unsafe play by 10.8 pp, while the mapping where Q means Safe raises it by 9.5 pp. The code number is an identity of the counterbalancing, twice this route's excess use of the letter Q.
