

Does playing more Unsafe pay off? Per-player Unsafe rate vs. realised payoff

Human payoff is a reconstructed proxy (stage payoff + prize; the file has no setback/risk-draw field, so this omits the setback penalty entirely and is an upper bound). LLM panels show both the same proxy (x, grey) and the true realised final_payoff (dots, colored, includes the actual setback draw) so the setback's effect on the relationship is visible directly.
